Strategic Assessment

The purpose of this is to see how you think, and whether that could align with what we're looking for. Please be earnest, punctual, and have fun with it!

Creative Process Engineer Assignment

Objective :

Design and test a workflow that generates on-brand product description images for e-commerce.

The Brief

You're working with a D2C brand of your choice. Your job is to **design a complete workflow** where:

1. A brand provides: product name, key features, target audience, brand guidelines (colors, tone)
2. **AI executes:** research competitor visuals → extract style patterns → generate 3 product description image concepts
3. You output: 3 design direction briefs and images generated from the same workflow

Real-world context: Intent Farm uses this kind of workflow to help brands quickly ideate product imagery for Amazon listings, website hero sections, and paid ads.

What You'll Submit

1. Your Approach Document (1–2 pages)

Explain your thinking:

- **How did you structure the workflow?** (What are the steps? What does AI do vs. what requires human input?)
- **What information do you need upfront from the brand?** (Design a simple 1-page brief template.)
- **How did you define "done" for each step?** (What makes a good competitor analysis? What makes a good image concept brief?)
- **What could go wrong, and how'd you catch it?** (e.g., AI generating off-brand stuff, missing the product's core angle)

2. Live Workflow or Detailed Mockup

One of:

- **A working tool** (Make, Zapier, n8n, Google Apps Script, or even a simple Claude chatbot interface)—we test it with a real brand
- **Screenshots + step-by-step walkthrough** of the workflow (with actual prompts, form layouts, etc.)
- **A detailed Figma/Google Doc mockup** showing inputs, AI steps, and outputs with examples

3. Test Run Output

- **Input:** Use a real D2C brand (pick one: Nykaa, Purplle, Bewakoof, Decathlon India, or a brand you know well)
 - **Output:**
 - The brand brief template you'd use (filled in for your test brand)
 - 3 product description image concept briefs (these are specs/direction docs, not actual designs)
 - A short commentary: what worked, what didn't, what would you iterate?
 - The images generated from any AI of your choice - using the prompts generated above
-

Evaluation Criteria

We're looking for:

1. Creative Thinking (40%)

- Do you understand what makes a good product image? (Hero shot vs. lifestyle vs. detail; color psychology; hierarchy; target audience signal)
- Did you pick the *right* inputs from the brand to generate *useful* image concepts?
- Are your 3 concepts distinct and strategically different? (e.g., one emphasizes premium positioning, one emphasizes lifestyle fit, one emphasizes function)

2. Process Design (40%)

- Is the workflow simple but complete? (Does it actually work, or are there missing steps?)
- Did you design inputs that are *specific enough* that AI won't hallucinate, but *flexible enough* that it works for different brands?
- Is your output spec clear? (A designer or image-gen AI should be able to execute your image briefs without guessing)

3. Execution & Clarity (20%)

- Is your approach document easy to follow? (Can we understand your thinking without asking questions?)
 - Did you test the workflow? (Do the output concepts actually feel on-brand for the test brand?)
 - Is the work polished? (Not pixel-perfect, but thoughtful—no typos, clear formatting, shows you care)
-

What We DON'T Care About

- ❌ Writing perfect code or building a production-grade tool
 - ❌ Using fancy no-code platforms (Zapier vs. Make vs. n8n doesn't matter)
 - ❌ Having a beautiful UI (function > form here)
 - ❌ Knowing AI deeply (you don't need to know how Claude works under the hood)
-

What We DO Care About

- ✅ Showing you think like a creative person *and* a systems person
 - ✅ Proving you can design inputs that constrain AI usefully
 - ✅ Proving you can define outputs clearly enough for execution
 - ✅ Spotting where humans still need to make decisions (brand taste, strategy angle)
-

Why This Assignment

This mirrors what you'll actually do on day 1. You'll take a vague creative problem (e.g., "we need a way to generate PD images faster"), break it into steps, figure out where AI fits, design the human inputs, and define what success looks like. That's the job.

We're not testing whether you can code. We're testing whether you think like a creative person who *also* cares about systems, clarity, and constraints.

Good luck.

Deadline: Please submit the assignment within 48 hours of receiving this brief.
